CC niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, Cod contiguous nucleotides of a nucleotide sequence of S. salar SNPs, Cod co polymorphic sites and seabass polymorphic sites, or their complement; (2) CC a primer pair (III) suitable for use in PCR, comprising two (II) capable cod famplifying a nucleotide sequence chosen from S. salar SNPs and, O. cod cod polymorphic sites and seabass polymorphic sites, Atlantic halibut SNPs, Cod cod polymorphic sites and seabase polymorphic sites, and determining (M1) the comprising a collection of candidate parent genotype database comprising a parentage genotype database comprising a parentage genotype database comprising a parentage genotype and one of the candidate parent genotype identifies to the origin of the parentage genotype database, where a match between the sample genotype and one of the candidate parent genotype identifies to the origin of the sample. (M1) is useful for determining the origin of cardimolecule comprising SNP in a sample, which cod involves contacting the sample containing nucleic acid molecule comprising SNP in a sample, which comprising snew in a sample, comprising contacting the ample containing nucleic acid that hybridises to (II). (II) is comprised swith one or more contacting the comprising contacting the present containing a polymorphic sites or seabase polymorphic sites, and identifying a nucleic acid that hybridises to (II). (II) is useful for detecting nucleic acid that hybridises to (II). (II) is useful for detecting nucleic acid that hybridises to (II). (II) is useful for detecting nucleic acid that hybridises to (II). (II) is useful for detecting nucleic acid that hybridises to (II). (II) is useful for detecting nucleic acid that hybridises to (II) is useful for detecting nucleic acid that hybridises to (II) acid th

                                                                                                                                                                                                                                                                The invention relates to an isolated human GTP-activator protein for Rab-CC like GTPase (GAPN) polypeptide (I), a sequence having 65% identity to C (I), a sequence in which at least 95% of deviations from (I) are conservative substitutions, or a fragment of at least 8 contiguous amino C acids of (I). The polypeptide is useful for identifying a specific binding partner for itself, by contacting the polypeptide in vivo to a c potential binding partner and determining if the polypeptide binding the polypeptide (II) are useful for diagnosing or monitoring a disease caused c polypeptide (II) are useful for diagnosing or monitoring a disease caused c polypeptide of nucleic acids or monitoring a disease caused by altered expression of GARN, by determining the level of expression of GRAN, by determining the level of expression of c capression providing diagnostic and/or monitoring information. (I), (II) c associated with decreased expression or activity of GAPN, and an an c associated with increased expression or activity of GAPN (all claimed). (I) is useful for treating or preventing a disorder c associated with increased expression or activity of GAPN (all claimed). (I) is useful for treating or activity of GAPN (all claimed). (II) is useful to traits antibodies that specifically recognize GAPN proteins. (II) is useful to drive in vivo expression of C quantify GAPN nucleic acids in and isolate GAPN nucleic acids from both genomic and transcript-derived nucleic acid samples. This sequence c represents a 17-mer oligonucleotide spanning the GAPN DNA sequence.
                                                                     Query Match

Clike GTPase (GAPN) polypeptide (I), a sequence having 65% identity to
Clike GTPase (GAPN) polypeptide (I), a sequence in which at least 95% of deviations from (I) are
Closervative substitutions, or a fragment of at least 8 contiguous amino
Closervative substitutions, or a fragment of at least 8 contiguous amino
Closervative substitutions, or a fragment of at least 8 contiguous amino
Closervative substitutions, or a fragment of at least 8 contiguous amino
Closervative substitutions, or a fragment of at least 8 contiguous
Closervative substitutions, or a fragment of at least 8 contiguous
Closervative substitutions from the polypeptide in vivo to a
Closervative substitution of GAPN, by determining the level of expression of
Closervative substitution of GAPN, by determining the level of expression of
Closervative substitution of GAPN, by determining the level of expression of
Closervative substitution of GAPN, by determining the level of
Closervative substitution of GAPN, by determining the level of
Closervative substitution of GAPN, by determining the level of
Closervative substitution of GAPN, by determining information. (I), (II)
Closervative substitution of continuous from a subject
Closervative substitution of GAPN, and an an associated with increased expression or activity of GAPN, and an associated with increased expression or activity of GAPN, (all claimed).
Closervative substitution of GAPN proteins. (II) is useful to drive in vivo expression of
Closervative substitution probes to detect, characterize and
Closervative substitution of GAPN nucleic acids in and isolate GAPN nucleic acids from both
Closervative substitution of GAPN of the contracterize and
Closervative substitution of GAPN of the contracterize and
Closervative substitution of GAPN proteins and contracteric acids in and isolate GAPN DNA sequence.

Closervative substitutions of GAPN of the contracteric acids of the contracteric acids of the contracteric acids of the cont

```
CC like GTPsse (GAPN) polypeptide (I), a sequence having 65% identity to CC like GTPsse (GAPN) polypeptide (I), a sequence having 65% identity to CC (II), a sequence in which at least 95% of deviations from (I) are CC conservative substitutions, or a fragment of at least 8 contiguous amino CC acids of (I). The polypeptide is useful for identifying a specific collinding partner for itself, by contacting the polypeptide in vivo to a potential binding partner and determining if the polypeptide binding CC partner binds to the polypeptide. (I) and a nucleic acid encoding the polypeptide (II) are useful for diagnosing or monitoring a disease caused CC polypeptide (II) are useful for diagnosing or monitoring a disease caused CC by altered expression of GAPN, by determining the level of expression of GAPN in a sample of nucleic acids or proteins that derives from a subject CC suspected to have the disease, alterations from a normal level of expression providing diagnostic and/or monitoring information. (I), (II) CC or agonist of (I) is useful for treating or preventing a disorder associated with decreased expression or activity of GAPN, (and an associated with horeased expression or activity of GAPN, (all claimed). CC (I) is useful as immunogen to raise antibodies that specifically recognize GAPN proteins. (II) is useful to drive in vivo expression of CC GAPN proteins, and as hybridization probes to detect, characterize and CC quantify GAPN nucleic acids in and isolate GAPN nucleic acids from both genomic and transcript-derived nucleic acid samples. This sequence.

CX represents a 17-mer oligonucleotide spanning the GAP. DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human GAP_N DNA 17-mer oligo #119.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel human GTP-activator protein for Rab-like GTPase and polynucleotide encoding the protein, useful for diagnosing, treating or preventing disorders associated with increased expression or activity of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           gene therapy;

                                                                                                                                                                                                                                                          8
                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated human GTP-activator protein for Rab-
Clike GTPase (GAPN) polypeptide (I), a sequence having 65% identity to
Clike GTPase (GAPN) polypeptide (I), a sequence having 65% identity to
Clip a sequence in which at least 95% of deviations from (I) are
Clip are conservative substitutions, or a fragment of at least 8 contiguous amino
Clip acids of (I). The polypeptide is useful for identifying a specific
Clip inding partner for itself, by contacting the polypeptide in vivo to a
Clip inding partner and determining if the polypeptide binding
Clip partner binds to the polypeptide. (I) and a nucleic acid encoding the
Clip partner binds to the polypeptide. (I) and a nucleic acid encoding the
Clip partner binds to the polypeptide. (I) and a nucleic acid encoding the
Clip partner binds to the polypeptide. (I) and a nucleic acid encoding the
Clip partner binds to the polypeptide. (I) and a nucleic acid so roteins that derives from a subject
Clip partner binds to the polypeptide of proteins that derives from a subject
Clip partner binds to full are useful for treations from a normal level of
Clip partner binds to full is useful for treating or preventing a disorder
Clip associated with decreased expression or activity of GAPN, and an
Clip clip and an animonogen to raise antibodies that specifically
Clip consisted with increased expression or activity of GAPN (all claimed).
Clip is useful as immunogen to raise antibodies that specifically
Clip consisted with as homomogen to raise antibodies that specifically
Clip consist of (I) is useful to drive in vivo expression of
Clap proteins, and as hybridization probes to detect, characterize and
Clip condition and transcript derived nucleic acid samples. This sequence
Clip is useful acids of an and isolate GAPN DNA sequence.

Crepresents a 17-mer oligonucleotide spanning the GAP. DNA sequence.
                                                                                                                                                                                                                                                                                                             Query Match

CC like GTPase (GAPN) polypeptide (I), a sequence having 65% identity to CC (IK), a sequence in which at least 95% of deviations from (I) are conservative substitutions, or a fragment of at least 8 contiguous amino CC acids of (I). The polypeptide is useful for identifying a specific CC binding partner for itself, by contacting the polypeptide in vivo to a CC pertner binds to the polypeptide. (I) and a nucleic acid encoding the polypeptide (II) are useful for dearmining if the polypeptide binding CC partner binds to the polypeptide. (I) and a nucleic acid encoding the CC polypeptide (II) are useful for diagnosing or monitoring a disease caused CC by altered expression of GARN, by determining the level of expression of CC (GARN in a sample of nucleic acids or proteins that derives from a subject CC expression providing diagnostic and/or monitoring information. (I), (II) CC or agonist of (I) is useful for treating or preventing a disorder CC associated with decreased expression or activity of GARN, and an CC antagonist of (I) is useful for treating or preventing a disorder CC associated with increased expression or activity of GARN, (all claimed). (CC (I) is useful as immunogen to ratio activity of GARN, and an activity GARN (all claimed). (CC (I) is useful as immunogen to ratio activity of GARN (all claimed). (CC (I) is useful as immunogen to ratio activity of GARN (all claimed). (CC (I) is useful as immunogen to ratio activity of GARN (all claimed). (CC (I) is useful as immunogen to ratio activity of GARN (all claimed) activity of GARN (all claimed) are proteins, and as hybridization probes to detect, characterize and condition and isolate GARN nucleic acids from both genomic and transcript-derived nucleic acids samples. This sequence are presents a 17-mer oligonucleotide spanning the GARN DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel human GTP-activator protein for Rab-like GTPase and polynucleotide encoding the protein, useful for diagnosing, treating or preventing dispress associated with increased expression or activity of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gene therapy; antibody therapy; modulator GTP-activator for Rab-like GTPase; GAP_N;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2003-403224/38

                                                                                                                                                                                                                                                                                                                                                                                                                                CC like GTPase (GAPN) polypeptide (I), a sequence having 65% identity to CC (I), a sequence in which at least 95% of deviations from (I) are comperative substitutions, or a fragment of at least 8 contiguous amino acids of (I). The polypeptide is useful for identifying a specific CC binding partner for itself, by contacting the polypeptide in vivo to a potential binding partner and determining if the polypeptide binding partner binds to the polypeptide. (I) and a nucleic acid encoding the collypeptide (II) are useful for diagnosting or monitoring a disease caused CC polypeptide of nucleic acids or proteins that derives from a subject by altered expression of GAPN, by determining the level of expression of CC cappession providing diagnostic and/or monitoring information. (I), (II) corresponds to f(I) is useful for treating or preventing a disorder associated with decreased expression or activity of GAPN, and an CC associated with increased expression or activity of GAPN (all claimed). (I) is useful to trait or activity of GAPN (all claimed). (I) is useful as immunogen to raise antibodies that specifically recognize GAPN proteins. (II) is useful to drive in vivo expression of CC suppression and as hybridization probes to detect, characterize and CC guantify GAPN nucleic acids in and isolate GAPN nucleic acids from both cappendic and transcript-derived nucleic acid samples. This sequence.
                                                                                                                                                                                                                                                                                                                                    Query Match

CC like GTPase (GAPN) polypeptide (I), a sequence having 65% identity to CC (I), a sequence in which at least 95% of deviations from (I) are CC conservative substitutions, or a fragment of at least 8 contiguous amino CC acids of (I). The polypeptide is useful for identifying a specific conservative substitutions, or a fragment of at least 8 contiguous amino CC potential binding partner and determining the polypeptide in vivo to a CC potential binding partner and determining if the polypeptide in vivo to a CC potential binding partner and determining if the polypeptide binding CC partner binds to the polypeptide. (I) and a nucleic acid encoding the CC polypeptide (II) are useful for diagnosing or monitoring a disease caused by altered expression of GAPN, by determining the level of. Expression of CC GAPN in a sample of nucleic acids or proteins that derives from a subject CC expression providing diagnostic and/or monitoring information. (I), (II) CC expression providing diagnostic and/or monitoring a disorder CC associated with increased expression or activity of GAPN, and an associated with increased expression or activity of GAPN, and an associated with increased expression or activity of GAPN and an associated with increased expression or activity of GAPN (all claimed). (I) is useful to raise antibodies that specifically captain and as hybridization probes to detect, characterize and CC GAPN proteins, and as hybridization probes to detect, characterize and cc genomic and transcript-derived nucleic acids samples. This sequence corporates as 17-mer oligonucleotide spanning the GAP_N DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel human GTP-activator protein for Rab-like GTPase and polynucleotide encoding the protein, useful for diagnosing, treating or preventing disorders associated with increased expression or activity of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2003-403224/38

Primers KBA-gamma2 and RWAG-1 (AAQ42271 and AAQ42272, respectively) were used to amplify the 3'-end (constant region) of the Fd gene from a source plasmid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 18
                                         The sequence is that of an antisense oligonucleotide complementary (with two mismatches) to a target sequence of the bor-abl mank transcript AAQ34631, which includes the bor-abl translocation junction and not more than about 13 nucleotides of the abl-derived portion of the transcript. It is used as part of a method to treat leukaemias characterised by the philadelphia chromosome translocation. It is highly selective and partient specific unlike conventional chemotherapy, which affects non-malignant cells. Dosage selection is thus less critical than with conventional treatment.                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence is that of an antisense oligonucleotide complementary to a target sequence of the bcr-abl mRNA transcript ARQ34631, which includes the bcr-abl translocation junction and not more than about 13 nucleotides of the abl-derived portion of the transcript. It is used as part of a method to treat leukaemias characterised by the Philadelphia chromosome translocation. It is highly selective and patient specific unlike conventional chemotherapy, which affects non-malignant cells. Dosage selection is thus less critical than with conventional treatment. The junction sequence was used in the preph. of antisense oligonuclectides which can be used as part of a method to treat leukaemias characterised by the Philadelphia chromosome translocation. This method is highly selective and patient specific unlike conventional chemotherapy, which affects non-malignant cells. Dosage selection is thus less critical than with conventional treatment. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating Ph1-positive leukaemia(s) using bcr-abl anti-sense oligo-nucleotide(s) - to selectively inhibit leukaemic cell proliferation without adversely affecting normal haematopoiesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                25-MAR-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is a TNF-alpha mRNA target sequence (nucleotide no. 1084) of an tenzymatic RNA molecule (ribozyme) which cleaves mRNA associated with tevelopment or maintenance of a psoriatic or asthmatic condition. The concen. of the ribozyme necessary to effect a therapeutic treatment is lower than that of an antisense oligonucleotide and the specificity of action is higher. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the
```

AAQ76140 and AAQ76141 are a pair of primers for the PCR amplification the Fd gene 3' (constant region), they were used in the construction of Fd::RMA linker::gelonin cytotoxic therapeutic agent (CTA), immunoconjugate. CTAs can be used in the treatment of diseases where telimination of a particular cell type is desired, such as autoimmune

n of a

polynucleotide(s) encoding type I ribosome-inactivating proteins - which are suitable for use as components of cytotoxic therapeutic agents.

                                                                                                                                                   The sequence of an antisense oligonucleotide to the chick nerve growth factor receptor (NGFR) gene which was used as a control for the survival of mouse dorsal root ganglial (DRG) cells treated with oligonucleotides AAQ87641-2. These oligonucleotides are antisense sequences directed at down-regulating the expression of the gene encoding the mouse p75 NGFR gene. The oligonucleotides can be used in methods to treat neurodegenerative conditions associated with disease and/or trauma such as Alzheimer's, Parkinson's or Hungtington's disease, multiple sclerosis vascular ischaemia associated with stroke, etc
                                                                                                                                                                                                                                                                                                                                               Anti:sense oligo:nucleotide(s) to nerve growth factor receptor gap 75 NGFR, down-regulate expression and enhance neurone survival; treating cerebal palsy, Alzheimer's disease, stroke, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 1995-170186/22.

                                                                                                                                                                                                                                                                         Plasmid pSH4 contains an Fd gene linked in frame to the RMA linker sequence. The RMA gene segment was linked to the 3'-end of Fd by overlap extension PCR as follows. The 3'-end (constant region) of the Fd gene was amplified by PCR from a source plasmid with the primers KBA-gamma2 and RMAP-1. The product of this reaction was mixed with primer RMA-76, which annealed to the amplified product of the first reaction, and the mixture was amplified with primers KBA-gamma2 and RMAK-2. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polynucleotide(s) encoding for intermolecular bonding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 based on an antiserse sequence against the c-myb target. These sequences of are oligonucleotides of the invention. These sequences can be modified to become more nuclease resistant, using phosphorothicate, or 3'-carbon modified links. To screen for modified multi-G sequences that inhibit cell proliferation, cultured smooth muscle cells that are arrested in the GO phase, are induced to proliferate in the presence of the multi-G sequence. The cultured smooth muscle cells used in this method are attached to a solid support, and growth arrest is cachieved on a starvation medium, followed by transfer to a normal growth medium to induce proliferation. The compounds that provide over 50% inhibition at a set dosage are selected as being useful for inhibiting vascular restenosis. The multi-G oligonucleotides are used to inhibit to proliferation of smooth muscle cells, such as to prevent arterial restenosis. These sequences are not artisense sequences, but are thought to work in a similar way. The sequences are thought to act by binding to proteins involved in the proliferation process. Compounds containing to these multi-G oligonucleotides are not toxic, and their effect on cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        An oligomer has been produced which is capable of inhibiting expression CC of a collagen gene. The present sequence represents a specifically CC claimed oligomer Oligo 164 APS, which binds to the polypurine-CC polypyrimidine region of the rat alphal(1) collagen gene promoter region. CC The oligomer may be used to impede pathological fibrosis which is associated with myocardial fibrosis in hypertensive heart diseases, CC associated with myocardial fibrosis, lung fibrosis, and skin fibrosis found in scleroderma, in hypertrophic scars and in skin CC fibrosis found in scleroderma, in hypertrophic scars and in skin CC following burn injury. The oligomer inhibits expression of a collagen CC gene after insertion into a cell by causing an intracellular reaction CC which inhibits gene expression. The oligomer is preferably a triplex CC forming oligomer (TFO) which is targeted to a 30-mer polypurine CC oligomuclectide corresponding to the noncoding strand of the promoter CC between -170 and -140. This section was chosen due to its binding CC stability at physiological pH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best Loc

The oligomer inhibite expression of a collagen gene after insertion into a cell by causing an intracellular reaction which inhibits gene expression. The oligomer is preferably a triplex forming oligomer (TFO) which is targeted to a 30-mer polypurine oligomelectide corresponding to the noncoding strand of the promoter between -170 and -140. This section was chosen due to its binding stability at physiological pH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              An oligomer has been produced which is capable of inhibiting expression of a collagen gene. The present sequence represents an oligomer Oligo 164 AP, which binds to the polypurine-polypyrimidine region of the rat alphal(I) collagen gene promoter region. The oligomer may be used to alphal(I) collagen gene promoter region. The oligomer may be used to impede pathological fibrosis which is associated with myocardial fibrosis impede pathological fibrosis which is associated with myocardial fibrosis.

cell N

PCR primers (AAT61596-604) are used to amplify fragments of the Humicola lanuginosa lipase gene coding sequence (see also AAT61593). For example, primer 4699 (AAT61597) can be used with primer 5164 (AAT61598) to make a 900 bp fragment. The lipase gene fragments are used in an improved method of preparing positive polypeptide variants (see also AAW13557-58). This involves shuffling opened plasmid and homologous DNA sequences in an iterative in vivo recombination system using a eukaryotic cell (such as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          of a collagen gene. The present sequence represents a specifically collaimed oligomer Oligo 147 P, which binds to the polypurine-polypurindine region of the rat alphal(I) collagen gene promoter region. The oligomer may be used to impede pathological fibrosis which is associated with myocardial fibrosis in hypertensive heart diseases, atherosclerosis, restenosis, liver cirrhosis, lung fibrosis and skin fibrosis found in scleroderma, in hypertrophic scars and in skin fibrosis found in scleroderma, in hypertrophic scars and in skin fibrosis found injury. The oligomer inhibits expression of a collagen gene after insertion into a cell by causing an intracellular reaction which inhibits gene expression. The oligomer is preferably a triplex forming oligomer (TFO) which is targeted to a 30-mer polypurine oligomucleotide corresponding to the moncoding strand of the promoter between -170 and -140. This section was chosen due to its binding contability at physiological pH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR primers (AAT61607-615) are used to amplify fragments of the Humicola lanuginosa lipase gene coding sequence (see also AAT61593). For example, primer 4699 (AAT6.608) can be used with primer 5154 (AAT6.1609) to make a 900 bp fragment. The lipase gene fragments are used in an improved method of preparing positive polypeptide variants (see also AAW13561-62). This involves shuffling opened plasmid and homologous DNA sequences in an iterative in vivo recombination system using a eukaryotic cell (such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preparing polypeptide variants with improved functional properties - b in vivo recombination between opened plasmid and homologous DNA, to produce e.g. enzymes with improved washing and dishwashing properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              11-AUG-1995;

Primers (see AAV44603-18) were designed to amplify hUCP2 exons 4, 6, 7 and 8 from genomic DNA. Common amino acid variants (see AAW69166) are present in exons 4, 6 and 8, A55V in exon 4, N190S in exon 6, and L294M in exon 8 (see also AAV4595). Restriction enzymes have been been identified that would differentially digest each of the alleles. The invention relates to a method for treating disease associated with altered UCP2 expression, such as obesity, diabetes, syndrome X, hypothermia, hyperinsulinaemia, glucose incolerance, wasting, anorexia, inflammation, cachexia, fever or hyperthermia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Surwit RS,

The method involves combining a group-specific untranslated region primer pair with a target DNA to allow primer-based amplification of the DNA, and determining whether a nucleic acid product is produced by the amplification. The ability of the primer pair to produce a product is associated with a particular HLA group type. The methods can be used for typing the 3 classical HLA Class I genes (comprising the loci HLA-A, HLA-B, and HLA-C) in e.g. donors and hosts for tissue transplantation. The initial group specific amplification allows a PCR based separation of haplotypes in 95% of patient samples. The subsequent sequencing can provide for high-resolution typing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HLA Class I typing - by primer-based amplification of target DNA using group-specific untranslated region primer pair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WC9826091-A2

```
Method of analysing nucleic acid in expressed genes, and distinguishing and non-cancerous tissues.
                                                                                                                                               WPI; 1998-506373/43
                                                                                                                                a sample - used for analysing between metastatic, non-metastatic
```

Example 1; Page 24; 55pp; English.

CC sample. The method comprises: (a) providing: (i) a sample containing CC sample. The method comprises: (a) providing: (i) a sample containing CC nucleic acid; (ii) a first primer having a sequence of which at least a CC portion is at least partially complementary to a natural common non-CC coding sequence on a portion of the nucleic acid of the sample; (iii) a CC second primer having a sequence of which at least a portion is at least cC partially complementary to a restriction enzyme recognition sequence of which at least a portion is at least cC present on a portion of the nucleic acid of the sample; and (iv) a CC plymerase and polymerase chain reaction (PCR) reagents; (b) preparing CC the nucleic acid from the sample under conditions so as to produce the nucleic acid from the sample under conditions so as to produce and second primers, the polymerase and the PCR reagents; (b) preparing CC and second primers, the polymerase and the PCR reagents under conditions cC such that amplified product is generated; and (d) detecting the amplified product. The method can be used for analysing expressed genes in multiple CC samples, especially in human cancer cells. The method can also be used to distinguish between metastatic and non-metastatic cancer tissues as well as between normal and cancerous tissue. It can also be used to detect of any resistance. The method can also be used to classify and identify used in an example from the present sequence represents a PCR anchor primer used in an example from the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
Best Local
consecutive cytosines; do not contain two sequences of three consecutive nucleotides each able to form three H-bonds to three consecutive cytosines, and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The oligonucleotides are used to modulate expression of genes, particularly the genes for p53, ErbB-2, jumb, jumb, TGR-beta 1 or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The oligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in case
                                                                                                                                                                                                                                                           AAV48485-564 represent antisense oligonucleotides directed against the p53 gene. Of these, only oligonucleotides AAV49485-517 resulted in effective downregulation of negative growth by p53 and increased cell proliferation, while AAV48518-64 had little effect. The oligonucleotides exemplify the invention. The specification describes oligonucleotides that contain 8-30 nucleotides, which contain at most 8 nucleotides that can each form three hydrogen bonds to cyrosine; do not contain four consecutive nucleotides able to form three H-bonds each to four
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonde, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   p53; antisense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SXS
                                                      AAV48412-84 represent antisense oligonucleotides directed against transforming growth factor beta-1 (TGF beta-1). The oligonucleotides exemplify the invention. The specification describes oligonucleotides that contain 8-30 nucleotides, which contain at most 8 nucleotides that can each form three hydrogen bonds to cytosine; do not contain four consecutive nucleotides able to form three H-bonds each to four consecutive cytosines; do not contain two sequences of three consecutive nucleotides each able to form three H-bonds to three consecutive cytosines, and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The conjugate of three such bonds (3R) is given by 2R/3R = 0.33-0.72. The conjugate of three such bonds (3R) is given by 2R/3R = 0.33-0.72. The conjugate of the genes for p53, ErbB-2, junB, junD, TGF-beta 1 or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The coligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                           The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell cand a second cell comprises: (a) obtaining the first cell and the second cell, (b) determining in the first cell and the second cell, (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family, and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for determining the can individual, e.g. a fetus. They can also be used for determining the containing cells capable of expressing an homeobox related desired groperty. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected containing the pattern of gene expression in a selected containing cells so determine the pattern of gene expression. The containing the selected from a set of homeobox genes, kinase genes, protein phosphatase genes, ps0 enzyme genes, steroid receptor contains to determine contains a selected respective contains to determine the pattern of gene expression.

                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a peptide ligand with specific affinity for the p24 protein of human immune deficiency virus-1 (HIV-1) comprising at least one peptide strand corresponding to the N-terminal region of the light and/or heavy chain of the Fab fragment of monoclonal antibody 1385 in which: (1) the light chain includes three hypervariable regions (HVR) at amino acid (aa) positions 24-33, 49-55 and 88-95 of AAV44175; and (ii) the heavy chain includes three HVR at as positions 26-35, 49-65 and 99-109 of AAV44176. The primers AAZ28808-Z28809 were used to PCR amplify the coding sequence for the heavy chain of Fab 1385 (AAZ28805). The peptide ligands are reagents for detecting p24 (by standard immunoassays) in biological samples, specifically for diagnosis of HIV-1 infection or can be used to treat HIV-1 infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide ligand; affinity; p24; human immune deficiency virus-1; HIV-1; light chain; heavy chain; Fab; monoclonal antibody; hypervariable region; infection; primer; PCR; amplification; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAZ28809;

                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                  A method has been developed of defining a set of compounds that modulate CC the expression of a target nucleic acid (tNA) sequence via binding of the CC compounds with the tNA sequence. The method comprises generating a CC library of virtual compounds in silico according to defined criteria, and CC evaluating in silico the binding of the virtual compounds with the tNA CC according to defined criteria. Also described are: (1) a method of CC defining a set of oligonuclectides (ONs) that modulate the expression of CC a tNA sequence via binding of the ONs with the tNA sequence comprising CC generating a library of virtual compounds in silico according to defined CC criteria, and evaluating in silico the binding of the virtual ONs with the tNA according to defined criteria; and (2) a method of defining a set CC compounds that modulate the expression of a tNA sequence via binding CC of the compounds with the tNA. The methods can be used for the generation CC and identification of synthetic compounds having defined physical, CC chemical or bioactive properties. Information gathered from assays of CC suchable to a variety of nucleotide sequence-based technologies, e.g. cantisense drug discovery and target validation. AAZ40852 to AAZ41220, and CC reached to AAY52706, represent sequences used in the exemplification of the properties.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC The present invention describes a method using novel primers involving CC the PCR-based determination of histocompatibility locus antigen B (HHA-B) CC class I group type. Determining the HHA-B class I group type of a subject comprises: (1) combining a group-specific untranslated region primer pair With a target DNA sample from the subject under conditions such that primer-based amplification of the target DNA may occur; and (ii) cetermining whether a nucleic acid product is produced by the amplification, where the ability of the primer pair to produce a nucleic acid product is associated with a particular HLA group type. The method can be used for HHA-B typing. In the method, the initial group specific amplification allows a PCR based separation of haplotypes in 95% of patient samples. It permits the resolution of cis/trans linkages of heterozygote sequencing results which cannot be achieved with other CC protocols. AAX37845 to AAX38286 represent DNA sequence used in the cc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Best Loc

The method can be used for HLA-B typing. In the method, the initial group specific amplification allows a PCR based separation of haplotypes in 95% of patient samples. It permits the resolution of cis/crans linkages of heterozygote sequencing results which cannot be achieved with other protocols. AAX37845 to AAX38286 represent DNA sequence used in the

Antisense inhibition of integrin alpha4 expression useful for treating inflammatory diseases such as atherosclerosis, allergies, asthma and

Example 8; Col 25; 40pp; English.

The invention relates to the generation of antisense oligonucleotides targeted to the integrin alpha4 gene (human sequence AAZ30555) which are used for inhibiting expression of the integrin alpha4 mRNA or protein. The oligonucleotides AAZ30556-Z30594 are used to inhibit human integrin alpha4 protein expression. Integrin alpha4 is a component of Very Late Antigen (VLA)-4 (also called alpha4) that and CD494(CD29). VLA-4 is expressed on the cell surfaces of leucocytes and vascular endothelial cells and mediates the adhesion of leucocytes to the vascular endothelial cells and mediates the adhesion of leucocytes to the vascular endothelian prior to migration into the surrounding tissues. This migration is an essential step in inflammation and hence VLA-4 (and consequently integrin diseases and the damaging effects of excessive inflammation. These diseases include atherosclerosis, allergies, asthma, rheumatoid

The present invention describes a method using novel primers involving the PCR-based determination of histocompatibility locus antigen B (HLA-B) Class I group type. Determining the HLA-B Class I group type of a subject comprises: (i) combining a group-specific untranslated region primer pair with a target DNA sample from the subject under conditions such that primer-based amplification of the target DNA may occur; and (ii) determining whether a nucleic acid product is produced by the

VLA-4 is also involved in a number of autoimmune diseases such as Grave's disease, Hashimoto's thyroiditis, encephalomyelitis (EAE), multiple sclerosis. VLA-4 may also be involved in promoting adhesion (i.e. retention) of hemopoletic stem cells in bone-marrow and in
The invention relates to a method of detecting an analyte in a sample. The method comprises providing a nucleic acid sequence which is initially catalytically inactive, but which becomes catalytically active in the presence of an analyte (the effector); providing a nucleic acid substrate for the catalytic activity of the nucleic acid sequence; and contacting the nucleic acid sequence and the substrate with the sample under conditions allowing catalytic activity of nucleic acid sequence. The catalytic nucleic acid sequence will be able to convert the nucleic acid substrate into a nucleic acid product only if the analyte of interest is present. The nucleic acid catalytic product is then amplified, and a significant increase in the amount of product indicates the presence of the sample. The method is useful for the qualitative or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ribozyme; catalytic RNA; analyte detection; effector molecule; nucleic acid substrate; in vitro selection; ribozyme ligase; conformation dependent activity; allosteric activation; mutant

CC quantitative determination of an analyte in a sample in diagnostic CC assays. The invention describes the in vitro selection of a ribozyme CC ligase (L1; AAA57859, AAA57860) which is catalytically active only in the CC presence of an oligonuclectide effector (AAA57854). The L1 ribozyme CC grandomised region 90 nuclectide in length flanked on both sides by CC constant sequence regions (the N90 RNA pool; AAA57851). In the presence of the effector, selection was performed using one of the tagged CC substrate molecules AAA57855-A57857. RNAs with ligase activity (i.e., CC those which have become ligated to the substrate molecule) were reverse CC effector and a DNA primer identical in sequence to the substrate used for the selection. A ribozyme ligase, L1, was selected via this procedure. L1 cc effector oligo (analyte). In the absence of the effector, L1 adopts an inactive conformation (AAA57859) in the presence of (AAA57859) in an exemplification of the invention

AAZ47685 to AAZ47768 represent phosphorothicate antisense coligonuclectides targeted to human CD40, which can be used to inhibit the expression of human CD40. CD40 is involved in lymphocyte activation, tumour growth and/or angiogenesis. Inhibition of CD40 is used to treat or

AAZ47769 represents the human CD40 nucleotide sequence. AAZ47770 to AAZ47772 represent human CD40 forward and reverse PCR primers, and a human CD40 PCR probe, respectively. AAZ47773 to AAZ47773 represent tother PCR primers and a probe used in the exemplification of the present invention
                                                        This sequence represents an oligomer which is capable of inhibiting the expression of the collagen gene. The oligomer is capable of binding to the promoter region of the collagen gene. Collagen is a family of fibrous proteins, and is the major element of skin, bone, tendon, cartilage, blood vessels and teeth. The oligomers are useful for inhibiting expression of the collagen gene, comprising inserting the oligomers into a capable of the collagen gene, comprising inserting the oligomers into a cell and causing an intracellular reaction to inhibit the gene expression. The collagen inhibitory oligomers of the invention are useful for treating pathological fibrosis associated with myocardial fibrosis in hypertensive heart disease, atherosclerosis, restenosis, liver cirrhosis, lung fibrosis, peritoneal fibrosis and skin fibrosis found in scleroderma, hypertrophic scars and burn injury
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Collagen; inhibit; myocardial fibrosis; hypertensive heart disease; atherosclerosis; restenosis; liver cirrhosis; lung fibrosis; burn i peritoneal fibrosis; skin fibrosis; scleroderma; hypertrophic scar;

                                                                                                                                                                                This sequence represents an oligomer which is capable of inhibiting the expression of the collagen gene. The oligomer is capable of binding to the promoter region of the collagen gene. Collagen is a family of fibrous proteins, and is the major element of skin, bone, tendon, cartilage, blood vessels and teeth. The oligomers are useful for inhibiting expression of the collagen gene, comprising inserting the oligomers into a causing an intracellular reaction to inhibit the gene expression. The collagen inhibitory oligomers of the invention are useful for treating pathological fibrosis associated with myocardial fibrosis in hypertensive heart disease, atherosclerosis, restenosis, liver cirrhosis, lung fibrosis, peritoneal fibrosis and skin fibrosis found in scleroderma, hypertrophic scars and burn injury
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Collagen; inhibit; myocardial fibrosis; hypertensive heart disease atherosclerosis; restenosis; liver cirrhosis; lung fibrosis; burn peritoneal fibrosis; skin fibrosis; scleroderma; hypertrophic scar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAZ98715
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Inhibitors of collagen gene useful for treating fibrosis associated with atherosclerosis, restenosis, liver cirrhosis, lung and skin fibrosis, comprises oligomers capable of inhibiting collagen gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rattus sp

The oligomer is capable of binding to the promoter region of the collagen gene. Collagen is a family of fibrous proteins, and is the major element of skin, bone, tendon, cartilage, blood vessels and teeth. The oligomers are useful for inhibiting expression of the collagen gene, comprising inserting the oligomers into a cell and causing an intracellular reaction to inhibit the gene expression. The collagen inhibitory oligomers of the invention are useful for treating pathological fibrosis associated with myocardial fibrosis in hypertensive heart disease, atherosclerosis, restenosis, liver cirrhosis, lung fibrosis, peritoneal fibrosis and skin fibrosis found in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibitors of collagen gene useful for treating fibrosis associated with atherosclerosis, restenosis, liver cirrhosis, lung and skin fibrosis, comprises oligomers capable of inhibiting collagen gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  17-FEB-2000.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is a human G-alpha-12 antisense nucleotide sequence. G-alpha-12 is a cemember of the G12/13 subfamily of G-proteins. The primary function of G-CC alpha-12 is in cell differentiation and growth. The invention relates to antisense compounds which are 8-30 nucleotides long (see AAZ57668-CC E37746). The antisense molecules are targeted to the human G-alpha-12 cm celleic acid molecule, and inhibit the expression of G-alpha-12. The collecules preferably have a modified internucleotide linkage, and at CC least one modified sugar moiety. The compounds target different regions cof the human G-alpha-12 RNA. The expression of human G-alpha 12 is CC inhibited by contacting human cells or tissues in vitro with the contacting human cells or tissues in vitro with the function of nucleic acid molecules encoding G-alpha-12, ultimately comodulating the amount of G-alpha-12 produced. The antisense compounds can be utilized for diagnostics, therapeutics, prophylaxis and as research captures and kits. They may be useful in the treatment of cancer, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

The antisense oligonucleotides have anticancer, anti-inflammatory and anti-infective activities. The phosphorothicate antisense oligonucleotides can be used for diagnosis, treatment and prevention of PTEN-related diseases, e.g. infections, inflammation and tumours. The present sequence represents a phosphorothicate antisense oligonucleotide for human PTEN,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compounds useful for treating, e.g. tumors or inflammation, are targeted to protein phosphatase (PTEN) sequence.
                                                                                                                                                                                                                                                                                                                                             TRADD; TNF; tumour necrosis factor; NF-kappa-B; apoptosis; programmed cell death; antisense; inhibition; treatment; therapy; septic shock; inflammation; cancer; antiinflammatory; human; ss.

                                                The intracellular protein TRADD has been identified as a critical link CC between tumour necrosis factor (TNF) receptor binding and downstream cc activation of NF-kappa-B. Overexpression of native TRADD activates NF-kappa-B in the absence of TNF and dominant negative mutants of TRADD cc lock TNF-induced NF-kappa-B activation. A second effect of TNF in many CC cell types is the induction of apoptosis (programmed cell death). TRADD coverexpression has been shown to mimic TNF induction of apoptosis as CC well. Data indicates that TRADD and other downstream effector proteins create the rate limiting step of TNF action and would therefore serve as the CC most efficient targets for inhibiting TRADD function may therefore be configurable of therapeutic, diagnostic and research applications. CC useful in a number of therapeutic, diagnostic and research applications. CC useful in a number of TRADD by contacting human cells or tissues with the antisense compound may be used to treat a disease or condition cassociated with TRADD expression, for example, septic shock, inflammation, or cancer. TRADD antisense oligonucleotides of varying chimibitory capabilities are listed in GENNESSO records AAZ39438-Z93517. The antisense oligonucleotides exhibit enhanced inhibitory capabilities are constants and a deoxy gap

52;

CC between tumour necrosis factor (TNF) receptor binding and downstream CC activation of NF-kappa-B. Overexpression of native TRAND activates NF-CC kappa-B in the absence of TNF and dominant negative mutants of TRAND CC block TNF-induced NF-kappa-B activation. A second effect of TNF in many CC cell types is the induction of apoptosis (programmed cell death). TRAND CC overexpression has been shown to mimic TNF induction of apoptosis as well. Data indicates that TRAND and other downstream effector proteins are the rate limiting step of TNF action and would therefore serve as the most efficient targets for inhibition of TNF-induced events. Antisense CC useful in a number of therapeutic, diagnostic and research applications. Inhibiting expression of TRAND by contacting human cells or tissues with the antisense compound may be used to treat a disease or condition CC associated with TRAND expression, for example, septic shock, inflammation, or cancer. TRAND antisense oligonucleotides of varying CC inhibitory capabilities are listed in GENESEQ records AAZ391438-Z93517. CC The antisense oligonucleotides exhibit enhanced inhibitory capabilities are listed in GENESEQ records AAZ391438-Z93517.

*8888888888 The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's Sequence 18 BP; 4 A; 7 C; 4 G; 3 T; 0 U; 0 Other;

expression, expression. Antisense compounds targeted to the coding region of human phosphatidylinositol 3-kinase (pI3K) p85 and inhibiting pI3K expression, useful for treating disorders associated with pI 13K p85 p13K p8

Claim 11; Col 39; 32pp; English.

The phosphatidylinositol 3-kinases (PI3Ks) represent a ubiquitous family of heterodimeric lipid kinases that are found in association with the cytoplasmic domain of hormone and growth factor receptors and oncogene products. PI3Ks act as downstream effectors of these receptors are recruited upon receptor stimulation and mediate the activation of second messenger signaling pathways. The PI3 kinase enzyme consists of a 110kD catalytic subunit (pl10) associated with an 85kD regulatory subunit (p85) and it is through the SH2 domains of the p85 subunit that the enzyme associates with the membrane bound receptors. PI3Ks have been implicated in many cellular activities including growth factor mediated cell transformation, mitogenesis, protein trafficking, cell survival and consideration and surrheads approaches a naturity contents and insulinand

The compounds may further be useful prophylactically, e.g., to prevent or delay infection, inflammation or tumour formation. The target site of this antisense molecule is nucleotide 88 of the coding region of the PI3K
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         stimulated glucose transport. Antisense compounds directed against PI3K p85 and which inhibit its expression are useful as diagnostics and research reagents, and as a component of kits, which can be used for detecting the level of pI3K p85 in a sample. The compounds may be
                       The present invention is concerned with the elucidation of the gene cluster from Streptomyces globisporus which regulates enediyne C-1027 synthesis. Enediyne C-1027 is an antibiotic, consisting of an apoprotein and a non-peptidic chromophore, which causes damage to DNA. The primers AAA63353-A63451 were used to isolate the open reading frames which comprise the gene cluster. The sequences within the gene cluster can be used to produce the protein and to identify antagonists, both of which can be used in the treatment of cancer
                                                                                                                                                                                                                                                                                Shen

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes the coding sequence for the enzymes from Bacillus cereus which form the zwittermicin A aminopolyol antibiotic. These enzymes are known as Orf1, Orf2, Orf3 and ZmaR. The antibiotic is useful in plants as a biocontrol agent as it help protect them from phytopathogens, which destroy crops. In addition, the coding sequence and phytopathogens, which destroy crops. In addition, the coding sequence and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel Bacillus zwittermicin A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 05-OCT-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bacillus cereus.

Claim 1; Col

response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is slso useful for preventing cancer, asthma, infectious disease, allergy or

Vaccinating against tumors, infectious diseases, allergies using immunostimulatory Py-rich and TG nucleic acids.

and asthma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is one of a number of antisense compounds of up to 30 nucleobases in length targeted to a nucleic acid encoding human Akt-1. The antisense compounds are useful for inhibiting the expression of human Akt-3 in human cells or tissues. They are also useful for modulating the expression of Akt-3, and for treating a human or an animal suspected of having, or being prone to, a disease or condition associated with Akt-3 expression. The antisense compounds may also be used as research.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAF99484 standard; DNA; 18

New antisense oligonucleotides targeting nucleic acids encoding useful for treating diabetes, increasing insulin sensitivity, or decreasing insulin resistance, blood triglyceride or cholesterol in a diabetic animal. PTEN, levels

Example 15; Col 41; 38pp; English.

The invention relates to a compound targeted to a nucleic acid encoding PTEN (a dual specificity protein phosphatase), where the compound is an antisense oligonucleotide. The antisense oligonucleotides are useful in modulating the function of nucleic acids encoding PTEN, ultimately modulating the amount of PTEN produced. The antisense compounds can used as diagnostics, therapeutics, prophylactics (e.g. to prevent or delay infection, inflammation or tumour formation), and as research agents and kits. The antisense compounds are also useful in treating diabetes, decreasing insulin resistance, increasing insulin sensitivity and decreasing blood triglyceride or cholesterol levels in a diabetic animal the process of accounts are also articonnol levels in a diabetic animal present sequence is an antisense oligonucleotide targetting oding PTEN (also known as MMACI/TEP1) the DNA

CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a supplied by performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or cligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides and for genotyping nucleic acid samples, for e.g. to consider the presence of an individual or group of coligonucleotides a participite trait suspected of being considered by one or more SNPs. Phenotypic traits include diseases e.g. coligonucleotides and acute intermittent porphyria. Phenotypic contents also include symptoms of or susceptibility to multifactorial coliseases, includes symptoms of or susceptibility to multifactorial coliseases, including, rheumatoid arthritis, multiple sclerosis, pathogenic conformation, cancer, nervous system diseases and infection by pathogenic conformation. The method is also useful in forensic investigations and conformation succeptibility to multifactorial conformations. The present sequence represents a PCR primer specific for a human SNP containing DNA sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         26-APR-2001

```

This invention describes a novel method, which does not require a culture stage, for predicting resistance to isoniazide in mycobacteria, isolated from clinical material, based on detecting a mutation in codon 315 of the katG resistance gene. A part of this gene is amplified by nested complymerase chain reaction (PCR) and the mutation is detected using a restriction endonuclease (RE). The method is used to predict isoniazide resistance in clinical isolates of mycobacteria, to assist selection of appropriate therapy. The method is simple and quick, does not require a clengthy preliminary culture step; detects over 99% of resistance-causing mutations in codon 315, and the only apparatus needed is a PCR construment, thermostat and gel electrophoresis system, making it suitable for routine use in non-specialized laboratories. When the preferred RE, acii, is used, the amplicon includes two other Acii sites that serve as internal controls, allowing false positives (caused by a faulty restriction reaction) to be avoided. This sequence represents the PCR primer MYC-33 which is used in the detection method described in the

The sequence is an antisense oligonucleotide targetting human integrin 4, creating involved in autoimmune and inflammatory diseases. The invention crelates to antisense inhibitors of integrin alpha 4 which target and cinhibit expression of integrin alpha 4. The antisense molecules are useful for inhibiting the expression of integrin alpha4 in human cells or tissues, treating an animal having a disease or condition associated with expression of integrin alpha4, e.g., inflammatory disease or condition, captession of integrin alpha4, e.g., inflammatory disease or condition, captession of integrin alpha4, e.g., inflammatory disease or condition, multiple captesion and tumour metastases, melanoma, asthma, psoriasis, allergy, cc and allograft rejection, and diseases or conditions characterised by cleukocyte migration into affected tissues, preferably central nervous cystem tissues. The antisense molecules are also useful for reducing the eyels of VLA-4 and alpha4beta7 integrin in human cells or tissues, and creducing the adherence of cells of a first type e.g., melanoma cells or inhibiting integrin alpha4 expression and thus decreasing adhesion of cells integrin alpha4 expression and thus decreasing adhesion of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Composition for treating inflammatory and autoimmune diseases, antisense compound targeted to nucleic acid molecule encoding alpha4 and inhibit expression of integrin alpha4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           05-OCT-1998;
